HOMEWORK #1 Solutions

FALL 2000

1.6 (a) Assume $x_a(t) = A \cdot \cos(2\pi f_0 t + \theta)$. Then

$$x(n) = A \cdot \cos(2\pi f_0 n T + \theta)$$

$$= A \cos\left(2\pi n \frac{T}{T_p} + \theta\right)$$

For periodicity, we require $x(n) = x(n+N)$ where N is the fundamental period of $x(n)$. $(N: \text{integer})$

$$\text{i.e. } A \cos\left(2\pi n \frac{T}{T_p} + \theta\right) = A \cos\left(2\pi (n+N) \frac{T}{T_p} + \theta\right)$$

This is true iff there exists an integer k such that

$$2\pi N \frac{T}{T_p} = 2\pi k \quad \text{i.e.}$$

$$\boxed{\frac{T}{T_p} = \frac{k}{N}}$$

(b) Fundamental period of $x(n)$ in seconds

$$\rightarrow N \cdot T$$

(c) From (a). $N \cdot T = k \cdot T_p$.i.e. fundamental period of $x(n)$, in seconds,is equal to an integer number of periods of $x_a(t)$.1.7. (a) $\geq 20 \text{ kHz}$ (b) Aliasing. Generating frequency $f_1' = -3 \text{ kHz}$ (c) Aliasing. Generating frequency $f_2' = 1 \text{ kHz}$ 1.8. (a) 200 Hz (b) 125 Hz 1.9 (a) $f_1 = 240 \text{ Hz}$ $f_2 = 360 \text{ Hz}$

$$\therefore F_N = 2 \cdot f_{\max} = 720 \text{ Hz}$$

(2)

$$(b) F_s = 600 \text{ Hz.} \quad \text{Folding frequency} = \frac{F_s}{2} = 300 \text{ Hz.}$$

$$\begin{aligned} (c). \quad x(n) &= x_a(nT) = x_a\left(\frac{n}{F_s}\right) = \sin 2\pi \cdot \left(\frac{2}{5}\right)n + 3 \sin 2\pi \cdot \left(\frac{3}{5}\right)n \\ &= \sin 2\pi \cdot \left(\frac{2}{5}\right)n + 3 \cdot \sin 2\pi \cdot \left(-\frac{2}{5}\right)n \\ &= -2 \sin 2\pi \cdot \left(\frac{2}{5}\right)n \end{aligned}$$

$$\therefore \text{Frequency of } x(n) = \frac{2}{5} \cdot 2\pi = \frac{4\pi}{5} \text{ (radians/sample)}$$

$$(d) y_a(t) = -2 \sin 2\pi \cdot \frac{2}{5} \cdot 600t = -2 \sin 480\pi t.$$

$$1.11 \quad x_a(t) = 3 \cos 100\pi t + 2 \sin 250\pi t$$

$$F_s = 1/T = 200 \text{ samples/s.}$$

$$\begin{aligned} \therefore x(n) &= 3 \cos \left(\frac{100\pi}{200} n \right) + 2 \sin \left(\frac{250\pi}{200} n \right) = 3 \cos 2\pi \left(\frac{1}{4} \right) n + 2 \sin 2\pi \left(\frac{5}{8} \right) n \\ &= 3 \cos 2\pi \cdot \left(\frac{1}{4} \right) n - 2 \sin 2\pi \cdot \left(\frac{3}{8} \right) n \end{aligned}$$

$$F'_s = 1/T' = 1000 \text{ samples/s.}$$

$$\begin{aligned} \therefore y_a(t) &= 3 \cos 2\pi \cdot \left(\frac{1}{4} \right) \cdot 1000t - 2 \sin 2\pi \cdot \left(\frac{3}{8} \right) \cdot 1000t \\ &= 3 \cos 500\pi t - 2 \sin 750\pi t. \end{aligned}$$

3

2.10 H-time invariant.

$$\begin{aligned} \mathcal{X}_1(n) &= \{1, 0, 2\} \xrightarrow{H} y_1(n) = \{0, 1, 2\} \\ \mathcal{X}_2(n) &= \{0, 0, 3\} \xrightarrow{H} y_2(n) = \{0, 1, 2\} \\ \mathcal{X}_3(n) &= \{0, 0, 0\} \rightarrow y_3(n) = \{1, 2, 1\} \end{aligned}$$

Is H linear?

$$\begin{aligned} h(n) &= H[\delta(n)] = H[\mathcal{X}_3(n+3)] = y_3(n+3) = \cancel{\{1, 2, 1, 0\}} \\ \mathcal{X}_2(n) &= 3\delta(n-2) \Rightarrow y_2(n) \stackrel{?}{=} 3h(n-2) \quad \{1, 2, 1, 0, 0\} \\ 3h(n-2) &= 3\{1, 2, 1\} = \{3, 6, 3\} \neq y_2(n) \end{aligned}$$

\therefore H is not linear.

2.11 H-time invariant.

$$\begin{aligned} \mathcal{X}_1(n) &= \{-1, 2, 1\} \xrightarrow{H} y_1(n) = \{1, 2, -1, 0, 1\} \\ \mathcal{X}_2(n) &= \{1, -1, -1\} \xrightarrow{H} y_2(n) = \{-1, 1, 0, 2\} \\ \mathcal{X}_3(n) &= \{0, 1, 1\} \xrightarrow{H} y_3(n) = \{1, 2, 1\} \end{aligned}$$

Is H time invariant?

$$\begin{aligned} \mathcal{X}_4(n) &= \mathcal{X}_1(n) + \mathcal{X}_2(n) = \{0, 1, 0\} \quad y_4(n) = y_1(n) + y_2(n) = \{0, 3, -1, 2, 1\} \\ \mathcal{X}_5(n) &= \mathcal{X}_2(n) + \mathcal{X}_3(n) = \{1, 0, 0\} \quad y_5(n) = y_2(n) + y_3(n) = \{-1, 2, 2, 3\} \\ \mathcal{X}_4(n) &= \mathcal{X}_5(n-1) \quad \text{But} \quad y_4(n) \neq y_5(n-1) \end{aligned}$$

\therefore H is not time invariant.

(4)

2.13. Prove: A relaxed LTI system is BIBO Stable iff

$$\sum_{n=-\infty}^{\infty} |h(n)| \leq M_h < \infty$$

for some constant M_h .

Proof: (If part)

Assume $\sum_{k=-\infty}^{\infty} |h(k)| \leq M_h < \infty$ and prove that if $|x(n)| \leq M_i \quad \forall n$, then

$$|y(n)| \leq M_0 \quad \forall n.$$

$$|y(n)| \leq \left| \sum_{k=-\infty}^{\infty} x(n-k)h(k) \right|$$

$$\leq \sum_{k=-\infty}^{\infty} |x(n-k)| \cdot |h(k)| \quad (\text{Triangle Inequality})$$

$$= \sum_{k=-\infty}^{\infty} |x(n-k)| \cdot |h(k)|$$

$$\leq \sum_{k=-\infty}^{\infty} M_i \cdot |h(k)| \leq M_i \cdot M_h = M_0 \quad \forall n \text{ iff } \sum_{k=-\infty}^{\infty} |h(k)| \leq M_h$$

$$\Rightarrow |y(n)| \leq M_0 \quad \forall n.$$

(Only if part)

Now show that a bounded input may give rise to an unbounded output if $\sum_{n=-\infty}^{\infty} |h(n)| = \infty$.

$$\text{Consider } x(n) = \begin{cases} \frac{h^{+}(-n)}{|h(-n)|} & \text{for } h(-n) \neq 0 \\ 0 & \text{for } h(-n) = 0 \end{cases}$$

$$\text{Note: } |x(n)| = \begin{cases} 1 & h(-n) \neq 0 \\ 0 & h(-n) = 0 \end{cases}$$

Thus, this input is bounded. $\forall n$.

(5)

$$\Rightarrow y(0) = \sum_{k=-\infty}^{\infty} z(-k) h(k) = \sum_{k=-\infty}^{0} \frac{h^+(k) h(k)}{|h(k)|} = \sum_{k=-\infty}^{-n} |h(k)| = \infty$$

Thus, a bounded input gives rise to an unbounded output if $\sum_{k=-\infty}^{\infty} |h(k)| = \infty$. Therefore, for a system to be BIBO stable, it is necessary that $\sum_{k=-\infty}^{\infty} |h(k)| < \infty$.

$$2.45. \quad y(n) = a y(n-1) + b z(n)$$

(a) Assume system is relaxed, i.e. $h(n) = 0 \quad \forall n < 0$.

$$h(n) = y_{zs}(n) \mid z(n) = \delta(n).$$

$$\therefore h(0) = a h(-1) + b \delta(0) = b.$$

$$h(1) = a h(0) + b \delta(1) = ab.$$

$$\vdots \\ h(n) = a^n b u(n)$$

$$\sum_{n=-\infty}^{\infty} h(n) = \sum_{n=0}^{\infty} a^n b = \frac{b}{1-a} \quad (a < 1)$$

$$\frac{b}{1-a} = 1 \Rightarrow b = 1-a.$$

$$(b). \quad S(n) = y_{zs}(n) \mid z(n) = u(n).$$

$$S(0) = a S(-1) + b u(0) = b.$$

$$S(1) = a S(0) + b u(1) = ab + b$$

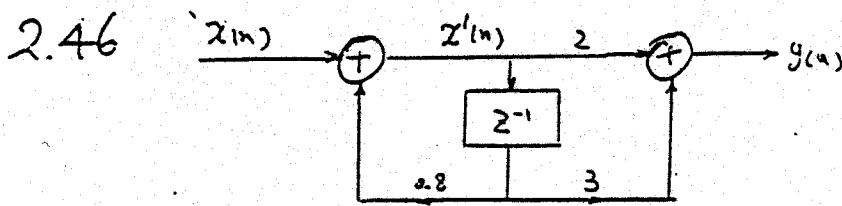

$$S(2) = a^2 b + ab + b.$$

6

$$S(n) = \sum_{k=0}^n b q^k = b \cdot \frac{1-q^{n+1}}{1-q} u(n) \quad (\text{for } |q| < 1)$$

$$S(\infty) = \frac{b}{1-q} = 1 \Rightarrow b = 1-q.$$

② $S(\infty) = \sum_{n=-\infty}^{\infty} h(n) = \frac{b}{1-q}$

③ $x'(n) = x(n) + 0.8x'(n-1)$

$$y(n) = 2x'(n) + 3x'(n-1)$$

Let $g(n) = x'(n) \Big|_{x(0)=1}$ then

$$g(0) = 1 + 0.8g(-1) = 1 + 0 = 1$$

$$g(1) = 0.8g(0) = 0.8$$

:

$$g(n) = (0.8)^n u(n).$$

$$\therefore h(n) = 2g(n) + 3g(n-1) = 2(0.8)^n u(n) + 3 \cdot (0.8)^{n-1} u(n-1)$$

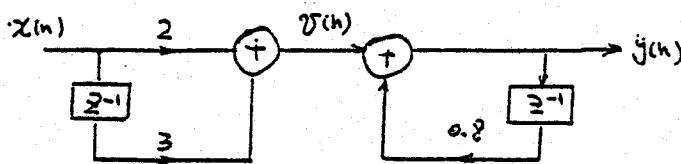

$$= 2(0.8)^0 \delta(n) + 2(0.8)^n u(n-1) + \frac{3}{0.8}(0.8)^n u(n-1)$$

$$= 2\delta(n) + 5.75(0.8)^n u(n-1)$$

$$= 2\delta(n) + 4.6(0.8)^{n-1} u(n-1)$$

(1)

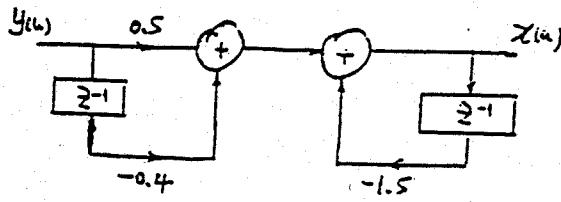

⑥ The direct Form I Realization for this system is:

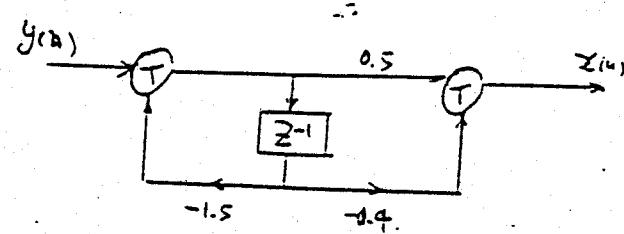

$$y(n) = e(n) + 0.8 y(n-1) \Rightarrow e(n) = y(n) - 0.8 y(n-1)$$

$$e(n) = 2x(n) + 3x(n-1) \Rightarrow x(n) = \frac{1}{2}e(n) - 1.5x(n-1)$$

$$= \frac{1}{2}y(n) - 0.4y(n-1) - 1.5x(n-1)$$

Direct Form I

Direct Form II

$$2.61 \quad x(n) = s(n) + r_1 s(n-k_1) + r_2 s(n-k_2)$$

$$\textcircled{4} \quad r_{xx}(l) = \sum_{n=-\infty}^{\infty} x(n) x(n-l)$$

$$= \sum_{n=-\infty}^{\infty} [s(n) + r_1 s(n-k_1) + r_2 s(n-k_2)] [s(n-l) + r_1 s(n-l-k_1) + r_2 s(n-l-k_2)]$$

$$= r_{ss}(l) + r_1 r_{ss}(l+k_1) + r_2 r_{ss}(l+k_2)$$

$$+ r_1 r_{ss}(l-k_1) + r_1^2 r_{ss}(l) + r_1 r_2 r_{ss}(l-k_1+k_2)$$

$$+ r_2 r_{ss}(l-k_2) + r_1 r_2 r_{ss}(l+k_1-k_2) + r_2^2 r_{ss}(l)$$

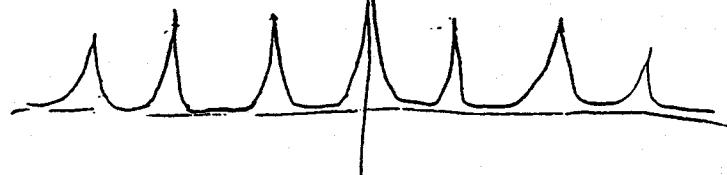

b) If $r_{ss}(l)$ has a sharp peak at $l=0$. $r_{ss}(l-k)$ will have a sharp peak at $l=k$.

In our case

$r_{xx}(l)$ will have peaks at $l=0, \pm k_1, \pm k_2, \pm |k_2 - k_1|$

We have 7 symmetrically distributed peaks with the largest at $l=0$

Envelope for $|r_{xx}|$ looks like

If we assume that k_2 is the larger lag value of the components of $x(n)$ we can find k_2 (corresponding to outermost peaks) as

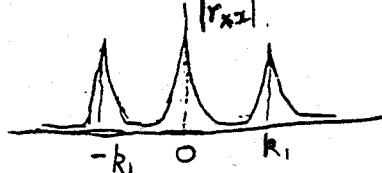

$$|k_2 - k_1| < |k_2| \quad \text{and} \quad |k_1| < |k_2|$$

Separating and identifying the peaks corresponding to k_1 and $k_2 - k_1$ though is impossible, as the middle two peaks between $l=0$ and $l=\pm k_2$, could correspond to either. Hence determining k_2 is possible but determining k_1 is impossible.

c) If $r_2 = 0$ we get

$$r_{xx}(l) = (1 + \lambda_1^2) r_{ss}(l) + \lambda_1 r_{ss}(l+k_1) + \lambda_1 r_{ss}(l-k_1)$$

Here k_1 can be determined exactly

Ratio of peaks at $0 \leq k_1$

Peak at 0	\div	$\frac{1 + \lambda_1^2}{\lambda_1}$
Peak at k_1		

Solve above quadratic equation and take positive value for λ_1 .
